### **STOP Security Tracking of Office Property Launches STOPLock, Patented Integrated Cable Lock and STOP Security Plate Device.**

Norwalk, CT, USA – July 20, 2007 – STOP announces the launch of STOPLock, a significant addition to its current line of Anti-theft, Recovery and Inventory Management System products and services.

Since the release of its patented STOP Security Plate system in 1991, STOP has been a leader in theft prevention, recovery and inventory-management systems for laptops, PDA's, projectors and other portable office equipment. While continuing to provide the traditional STOP Security Plate, the company is adding a new product to its offerings. STOPLock combines the proven effectiveness of the traditional STOP Security Plate with an added layer of physical protection by integrating it with a patented cable locking system.

Users simply engage the patented Snap-It cable locking device in a reinforced recess in the specially designed patented STOP Security Plate to doubly secure laptops and other equipment in offices, hotel rooms, conference halls, PC labs, campus residences, etc. When the equipment is transported, the cable is removed and the STOPLock Security Plate remains permanently affixed to the equipment, providing the same protection as the traditional STOP Security Plate. As with the traditional Plate, if the STOPLock Plate is forcibly removed (with great difficulty and with resulting damage likely), STOP's patented "Stolen Property" Tattoo with 24/7 Toll-free Recovery Hotline number remains chemically bonded to the equipment, adding further protection by eliminating illicit resale value and facilitating recovery.

Customers register their tagged equipment in STOP Monitor, a secure, Web-based Registration and Inventory Tracking System. Unlimited access to STOP Monitor and lifetime, transferable service is included with each STOP Security Plate or STOPLock purchased.

In addition, customers can use the optional STOP Monitor Mobile laser-scanner equipped PocketPC-based handheld device to perform inventory tracking and audit functions and upload and download data to and from STOP Monitor in real time.

"STOP's core business remains focused on preventing the theft of laptops, PDA's, and other office equipment through the use of our unique property identification system and patented 'Stolen Property' Tattoo," says STOP's president, Yves Berliet. "We're really excited about launching STOPLock because it provides customers another layer of physical security protection for their equipment. As a result, the total STOP system remains the most effective, efficient and affordable anti-theft, recovery and inventory management system available today."

STOP's clients include major government- and corporate accounts and educational institutions as well as individual users, college students and professionals. STOP, established in 1987, is a privately held company based in Norwalk, CT USA.
